News

6 News Desk Commodore's financial recovery continues . . . the 'bootleg' Amigas: more details . . . CSD divisions sold off . . . Electronic Arts, the background.

31 Communications David Wallin looks at the mailboxing facilities of Prestel, which include custom-made mailbox 'templates', as well as blank screens for you to fill out and despatch.

32 Soundcheck The USA is the place to be for music software at the moment, but Mark Jenkins tells you how to get hold of some of the American packages on import.

Features

14 Video Title Shop Jazz up your video screens with captions and some simple graphics with this program from Datasoft via US Gold. Chris Jenkins reports.

16 Electronic Arts EA has been renowned in the US for its games which involve a bit of thought and strategic awareness rather than heads-down, no-nonsense, mindless zapping.

Now the company has installed itself in the UK and given us a foretaste of its first releases for the British market. Peter Worlock samples some of the 26 titles on offer.

Programming

18 Learning Lisp In this, the final part of our guide to Lisp, Kenn Garroch takes you, step by step, through some practical applications of the language.

20 Listings Those RSX commands we publish for Amstrad CPCs are all very well, but how do you merge them together to use in one machine code program? Simon T Goodwin provides an answer in his routine this week.

For the Commodore 64, we have an interrupt routine which forms the basis of a mouse/pointer system, plus a sprite animation program for the BBC. And, for the 8-bit Atari machines, there's the first instalment of a complete assembler/disassembler.

27 Bytes and Pieces Short routines for you to type in, including a simplification of extra memory access on the Atari 130XE, a 'sprite investigator' on the Commodore 64, and a text facility for the Atari ST.

29 Peek and Poke Kenn Garroch answers your programming queries.

Games

41 New Releases Your complete guide to all the software released this week, including *Tai-Pan* (remember *Tai-Pan*?) from Ocean, Imagine's warrior-goddess *Athena*, and the latest in a long line of compilations, *Classix*, from The Edge.

LETTERS

Oasis - just a mirage

Having read the complaint from Miss Marion Tuck (Letters, August 7), about the function missing from an Oasis program, I felt compelled to write about a similar problem.

I was impressed with the initial view of the original Oasis package *White Lightning* and the range of facilities that the accompanying booklet described. Having bought the package for my Spectrum, I found that attempts to merge two pieces of assembler (saved by the program) caused the program to crash. A phone call to Oasis brought about the discovery that the original programmer had left the company and that they were aware of the omission because they were able to give me a patch to the basic program over the phone.

As I became more proficient I began to experiment with the 'macro' facilities described in the booklet. Apart from a minor success at the simple level, all the efforts at using the more useful aspects of this facility generated error messages.

Another phone call to Oasis was met with apologies and a promise of a free copy of their forthcoming replacement assembler/monitor/disassembler program. Suitably appeased I waited for the package to arrive. It never did and, like Miss Tuck, I was unable to track them down.

Alan J Baker
Bournemouth

Oasis ceased trading some time ago. However, below, Bob Kingham comes to the aid of Marion Tuck with her original query.

Sptgen: the missing link

Regarding Miss Marion Tuck's plea in Letters, August 7, here are lines 50110-50160 of Oasis's *Sptgen* which she lacks:

```
50110 DATA 133,36,230,73,102,36,169,

Patching up Micromon

Re Micromon, by P A Fairclough, *Popular Computing*, 15-21 May: unfortunately there are three bugs in this excellent program. Luckily two of them are easy to fix.

If you list a line in printable Ascii by using 'I' and press Return, some bytes may be changed unintentionally. The reason is that Commodore Ascii codes are not defined definitely.

If you print the Ascii-code of Shift A, you get 193 and C=A (Commodore A) returns 176. The other way round, you get capital A and the graphic character also by CHR\$(97) or CHR\$(240), respectively.

Assemble: old routine

```

```

Let's test it: Just enter M CFFO CFFF, then type I CFFO and finally again M CFFO CFFF. If you compare the hex-bytes of the two memory commands, you'll notice that some of them have changed their values. Now it's no longer possible, to display the register by pressing R. You only can avoid this by using Shift Return to leave Interpret-mode.

In case you want to overtype old text or enter a new one, make sure, that there are no program-bytes in this line. Otherwise you should enter the characters by 'address "aaaa ...

The other two bugs will be corrected by the enclosed patch. Firstly, the line-assembler doesn't allow all branches from -128 to +127. Instead it works only from -126 to +125.

Patch

```
10 ML=50637:REM ASSEMBLE
20 FORI=MLTOML+19
30 READA:POKEI,A:S=S+A:NEXT
40 IFS<>2468THENPRINT"FEHLER":END
50 ML=52774:S=0:REM LOAD
60 FORI=MLTOML+4
70 READA:POKEI,A:S=S+A:NEXT
80 IFS<>1080THENPRINT"FEHLER":END
90 DATA144,1,136,200,208,226,166,36,
208,1,24,202,202,176,3,16,215,
44,48,212
100 DATA234,234,234,234,144
READY.
```

Secondly, loading a file will always display a quotation mark even if no fault occurred. The program doesn't only check for the carry cleared, but also expects the SStatus (144) to be zero. But it always contains #64 after loading a file.

Load: old routine

```
52769 CE21 20 D5 FF JSR #FFD5
52772 CE24 B0 CC BCS #CDF2
52774 CE26 A5 70 LDA #90
52776 CE28 D0 C8 BNE #CDF2
52778 CE2A F0 2C BEQ #CE58
52780 CE2C 20 70 C8 JSR #C870
```

Load: new routine

```
52769 CE21 20 D5 FF JSR #FFD5
52772 CE24 B0 CC BCS #CDF2
52774 CE26 EA NOP
52776 CE28 EA NOP
52778 CE2A EA NOP
52780 CE2C 20 70 C8 JSR #C870
```

By the way, Micromon allows you to load programs to any wanted address by adding this at the end. Just type "L"name", 08,address. This gives you the possibility of loading two versions of a program to different memory locations, if you want to compare them.

The ups and downs at Compunet

I feel I must write to you in the interests of accuracy following a misleading article in your magazine.

The article, in *Popular*, July 24, was entitled "Compunet prices go down" and did not report the true effects of Compunet's new pricing policy.

Up until the end of June this year subscribers could access Compunet in two possible ways, either through one of twelve national nodes owned by ADP or through the ISTELE network.

Access via the ADP nodes was free to the user and 80% of subscribers using the service accessed in this way.

Initially, ISTELE access was an additional 60p per hour but this was increased some time ago to 90p per hour, this worked out fractionally cheaper than long distance telephone calls for those not within local range of a free node and was used by up to 20% of subscribers.

The new Compunet hardware and the closing of the ADP nodes mean that all users must now access through ISTELE.

This means an immediate increase in costs for the vast majority of users even though the ISTELE connect charge has been put back to its original 60p per hour.

The only people that will have their charges reduced are the small minority of users who already accessed via ISTELE.

Even the best possible deal for standard subscribers will involve an increase in subs to a Gold subscription followed by a further payment of £3.45 per quarter to cover any connect time, that can hardly be called a drop in prices!

Having said that, I am one of the tiny percentage who already used ISTELE and am already a Gold subscriber so I should find lighter bills. However we are a very small minority.

W M Barry
Bolton
Compunet ID: CATZ

Software for the Sord

With reference to the letter from Steven Folkess, in the July 31 issue, regarding more information about the Sord M5.

If you're after software, try Playfair Projects, 133 Hookfield, Harlow, Essex, CM18 6DL.

Also I've put together a mini NL free to any Sord users; if interested please write to Ross Carter, 16 Mayfield Road, North End, Portsmouth, Hants, 0703 696543. A few stamps to cover costs would be appreciated.

Ross Carter
Portsmouth

BOD adventure shock horror

I am writing to point out a mistake you made in the August 14 edition of *Popular*. You state in your New Releases column that *Book of the Dead*, a new Spectrum game available from CRL is an arcade game.

As a co-author of *BOD* I hope I can say, without fear of contradiction, that it is a graphic adventure and not an arcade game as stated.

I hope that you do not feel that I am being pedantic with this correction. With a shortage of good adventures available on the Spectrum (compared with arcade games) I feel that adventurers should know when a new game of this type becomes available. Commodore and Amstrad adventurers might like to know that *BOD* will soon be available on both tape and disc.

Tewkesbury, Glos

Geordie micro users wanted

I was wondering if any readers who own a Commodore 64 know of a computer club in Newcastle. I've tried various sources but with no success.

If anyone can help, could they phone me on 091-286 3603?

Steven Heley
Newcastle upon Tyne

Bitching and backbiting

There has been a great deal of bitching and backbiting over the old, old subject of whose computer is the best and, for what it's worth, I would like to have my say.

I personally could care little about the differences between the various brands of computer, each have their good and bad points.

However, after having being harangued recently by the owner of one brand of machine, I

decided to give machine popularity the acid test. This consisted of picking two non machine specific magazines at random (C&VG and yourselves) then covering three major points denoting popularity of machines; a) advertisements for software, b) reviews/news of new titles and c) suppliers' adverts.

The resulting figures (in percentages) for support of the top eight computers are as follows:

Commodore C64/128	58%
Spectrum 48/128	46%
Amstrad 464/664/6128	40%
Atari ST (all models)	34%
Commodore Amiga	17%
Atari (8 bit)	10%
BBC (inc Compact)	7%
Electron	4%

As a final note, I did a quick survey of the range of magazines available for the above computers and found that, once again, there were no surprises with the ratio of magazines reflecting their popularity.

Despite being only a quick spot survey, and we all know what they say about statistics, it does go to show that despite certain users' protestations, the level of support for home machines is as one would expect.

P Davis
Hull

Information comes forth

In reply to your request for information on Forth user groups, the obvious person to contact is the membership secretary of FIG UK: Colin Walls, 88 Woollahill Lane, Wokingham, Berks RG11 2TS.

In addition, readers in the Oxford area may be interested in an evening course on Forth programming. This takes place between 7.00-9.00pm on Thursdays.

Further details can be obtained from Judith Kennedy, Community Education Organiser, The Ferry Community Centre, Summertown, Oxford OX2 7PD (0865 52295).

Francis Glaisborough
Oxford

Screen test for the QL

Recently a correspondent owning a QL asked how it was possible for the computer to react when an on-screen barrier was reached.

I'm sorry I can't specify which issue, but if no other reply has

been received, could I suggest that *Illustrating Superbasic on the QL*, by Donald Alcock, published by Cambridge University Press, provides one answer.

On pages 161 and 162 he gives listings for a function and a procedure. The function PEER will return a number indicating the colour of a specified pixel; the procedure PORE will place a pixel of specified colour at indicated coordinates.

R A Hewett
Chelmsford

Silence on the racetrack

I'm writing in the hope that you can advise me on a computer game I bought a few months ago.

It's *Sport of Kings* by Mastertronic, and in the instructions it says that you can get speech if you use it with a Currah speech unit. I've been trying to do this, but it just won't work.

C W Hawkins
Bicester, Oxon

Mastertronic tells us that a speech option was planned for inclusion with *Sport of Kings*, but in the end was omitted. A few copies went out mentioning the speech feature on the inlay card, but this was removed in later runs of the game.

Hanging on the telephone

Either in late 1986 or early 1987, you published a series titled *Beginners' Guide to Computing*. Included was a listing for a 'phone book'. Is it still possible to obtain a copy of this listing?

Also, could someone tell me where I can obtain a copy of *Melbourne Draw*? I have found it impossible to get one from Spectrum dealers.

Les Rees
London N1

The phone book listing appeared in the issue dated January 29-February 4, 1987. To get a copy, contact Carol Frith in our back numbers department, at 12-13 Little Newport Street, London WC2H 7PP. Back issues cost 75p, inclusive of p and p.

Try getting in touch with Mastertronic for *Melbourne Draw*, at 8-10 Paul Street, London EC1, 01-377 6880.

Threat to the pawn

In Game Two of our readers' versus *Colossus* chess tournament, the readers, playing white, have continued their attack with the queen on black's knight side pawn. *Colossus* has defended by moving its pawn to h6.

Over to you

How would you continue the readers' attack?

Send your suggested move to either Inter-Mediate (*Popular Chess*), Freepost, Sawbridgeworth, Herts CM21 9YA (no stamp needed) or *Popular Chess*, Unit 2, The Maltings, Sawbridgeworth, Herts CM21 0PG (with a stamp).

Only one vote per person please, and all entries must reach either address by Wednesday, September 2.

The move which gets the most votes will be entered into the game. Results and *Colossus's* response will be published in two weeks time.

Next week we return to *Game One*, where the readers are playing back.

Game Two

Grey imports leave A500 buyers in cold

THE plot thickened in the boot-leg Amiga affair last week, as it emerged that the machines on sale in some UK dealers are not 'fake' as such at all, but unofficial, or "grey" imports from the Brunswick plant in West Germany.

It appears that European dealers or distributors may have offloaded stocks at a large discount into the UK to get rid of unsold machines.

Observers suggest that this may be evidence that European Commodore dealers may be having trouble selling A500 Amigas.

Whatever the reason, it's the customer who's at risk. Commodore UK managing director Steve Franklin last week urged customers to be very careful before buying any Commodore product which might not be a UK model.

"In any manufacturing, you can never always stop a grey import," he said.

"If they go to a reputable Commodore dealer and are given a special offer, the one question they should ask is: is it a UK model? Commodore UK will not honour any warranty on any machine from abroad that is not the same," he said.

One customer, who had bought a "grey" A500 from Gultronics in London's Tottenham Court Road, called News Desk.

"At first I had problems with *KickStart*, so I went into the shop and got a new *KickStart*. But the Amiga crashes easily and runs out of memory incredibly quickly," said the customer.

Gultronics has notified its branches of the grey imports and has instructed them not to take any similar machines if

Steve Franklin

they are offered them, following advice from Commodore.

Gultronics' customer liaison manager, a Mr Parkinson, last week insisted that any customers who had bought a grey machine could have it replaced, or if it was malfunctioning, they could have it repaired.

"We would implement a replacement if it was called for, and if our engineer can see that

it wasn't deliberately damaged," he said.

● A Commodore UK spokesman last week revealed that the company is planning a sponsorship bid for this year's Full Members' Cup. Discussions were due to be carried out in Copenhagen this week, and an announcement is expected shortly.

The Full Members' Cup is a competition for clubs from the English First and Second Divisions, which was organised to provide competition for English teams banned from European competition in the wake of the Heysel stadium disaster two years ago.

The move follows speculation earlier this month that Commodore UK was in the running to sponsor the Football League, although that deal eventually went to Barclays Bank.

Ruling on TVs used as monitors

THE Home Office last week clarified the legal position concerning the use of TV sets as computer monitors.

The matter has caused difficulties for a number of people prosecuted for not having a licence for such sets, even though the defendants claimed that sets were not used for receiving broadcast television programmes.

The Home Office Broadcasting Department said: "If a television set is used solely as a monitor in conjunction with a home computer or video game machine, a licence is not required."

It is of course up to the individual to prove that he or she never uses the set to receive broadcast programmes.

WHS software boost for Atari 520STFM

WH SMITH last week announced that it will be giving more than £200 worth of free software with every Atari 520STFM purchased. This follows Atari's recent announcement of a £100 price cut on the machine.

The promotion starts on September 1, and includes hit titles such as *Arkanoid*.

"We think that the Atari 520STFM is one of the most advanced computers in the home market which optimises the use of sound and graphics," said WHS computer buyer Ian Laurie.

"This excellent software package shows just what the computer is capable of and at no extra cost to the customer."

Gooch's cricket has all-star cast

AUDIOGENIC has released *Graham Gooch's All Star Cricket* for the C64.

The game follows on from the original *Graham Gooch Cricket*, and features a World and All-Time XI, as well as players and averages for England, Australia, West Indies, Pakistan, India, Sri Lanka and New Zealand.

Features include dropped catches, wides, bouncers and full tosses, as well as action replays after the fall of a wicket and a practice mode.

GGASC on the C64 costs £9.95 (tape), £11.95 (disc). Further information from Audio-genic, Winchester House, Canning Road, Wealdstone, Harrow, Middlesex HA3 7SJ, telephone 01-861 1166.

Dixons' PC1512 cut fuels rumours of official reduction

THIS summer's spate of speculation about price cuts last week moved on to the Amstrad PC1512.

Many dealers were up in arms at the news that Dixons has chopped £200 off its machines, and this fuelled rumours of an official Amstrad price cut next month.

Dixons' move could well precede cuts by other dealers needing to compete and a price reduction, nearer Christmas, from Amstrad itself can be expected.

The company is, however, remaining non-committal on the subject.

"If and when any price

The PC1460: has its recent launch created doubts about the pricing policy on the PC1512 series?

The Dixons cut on the 20Mb machine with colour monitor and one-year service contract brings it down to £1175 inclusive.

The chain is able to make the reduction thanks to its direct import link with the South Korean manufacturing plant, and has therefore angered other dealers unable to compete.

changes are to be made to any of our products, we will make a public announcement," said an Amstrad spokesman.

But the recent launch of the PC1640, and evidence suggesting that the PC1512 market has reached a plateau following the launch, means that some kind of price change is more than likely.

Eidersoft's sound of music

EIDERSOFT will be launching a number of additions to its *Pro* range of ST peripherals at next month's PCW Show.

The first is *Pro-Light*, which takes sampled sound from the Midi interface to feed light effects to the screen. *Pro-Drum* is naturally enough a drum

machine, while *Pro-Midi* is a software program to take sound from the Pro-Sound sampler.

All three are available separately for £16.95 inclusive, and the *Pro-Midi* package will also be bundled with *Pro-Sound* and a dumb Midi keyboard for about £100.

SOFTWARE HOTLINES

Well, how about the software industry's answer to the Peter Wright scandal?

According to **Microprose**, its next release is a simulation of a Stealth jet fighter, a new jet being developed by the US Air Force which is so secret that the USAF won't even acknowledge its existence.

Naturally Microprose is being rather coy about its source of information, but if you want to play around with the latest in top secret hi-tech then *Project: Stealth Fighter* will be released, initially for the C64, in just a couple of weeks.

You'll have to be careful with it though, and not let any nasty pinkos get their hands on it - after all, you wouldn't want to be responsible for the fall of the free world, would you?

Actually, hype aside, I have to give Microprose their due. A number of American outfits have announced new European operations lately in a blaze of publicity and an avalanche of vol au vents, then taken their time with the goods themselves. But at least Microprose seems capable of meeting its release dates, which means that any minute now we should have a finished copy of its *Moebius* game.

This is an animated role-playing game which combines martial arts combat, spell-casting, and a bit of interaction with the townsfolk of the island of Khantun.

And next month should see a change of direction with the

The plans of the top-secret Stealth fighter. Who says we're not controversial?

release of *Airborne Ranger*. In it, you play a paratrooper fighting your way to freedom after being dropped behind enemy lines.

Most of Prose's releases are complex aircraft simulation, but though it's desperately trying to avoid using the word this is really a *Commando* style arcade game.

Dig out the mac and trilby, and you can play the part of Steve Keen, "private spy", in Accolade's *Comics*. This is a complex interactive comic strip adventure, in which you play the hero attempting to unravel a series of complicated plots.

The game unfolds on screen like a conventional comic strip, except that you type in Steve's dialogue yourself, from a choice of three on-screen captions, and the ensuing action depends on your interaction with the characters you'll meet.

There have been similar things done in the past that didn't work too well, because of the simplistic approach caused by memory restrictions but this game is crammed on to three Commodore 64 discs, so it should be a bit more sophisticated than earlier attempts. At first glance, it certainly looks attractive. We'll report on the nitty-gritty of the gameplay next week.

Cliff Joseph

Airborne Ranger, Microprose's first arcade game.

NEXT
WEEK

Sound effects

Next week sees the start of a new programming series, this time on creating sound effects on your computer.

While we won't be telling you how to compose your own symphonies, the articles will be explaining some handy ways to use your micro's sound chip in your own programs.

from the
beginning

If you've been interested in getting going with a modem and dialling up bulletin boards and databases, taking advantage of electronic mail and telex facilities... but keep getting bogged down with terms like 'parity', 'Hayes standard' and 'baud rate', you can extricate yourself.

Steve Gold explains communications and networking for the beginner: what equipment you want, the jargon you need to understand, and the comms facilities you can access.

24-pin printers

A printer is probably the most sought-after peripheral for most micro owners, with 9-pin dot-matrix models being the most accessible in terms of price and compatibility.

However, if you've been thinking of upgrading your printer, to give your documents higher resolution and a more professional appearance without sacrificing speed or features, take a look at this selection of 24-pin dot matrix models.

3D graphics

Francis Botto explains the principles behind creating 3D images to use in your programs, with examples for you to use.

Sparklers and Pirate
arise from CSD ashes

THERE were two new developments last week arising from the ashes of major software distribution house CSD, which went into receivership last month.

First, Maynard International, which recently launched its Top Ten label, has bought the rights to the Sparklers range of games software.

In a separate move, former Creative Sparks man Leigh Richards has announced his own new budget label, Pirate Software. The first Pirate titles are due on September 30.

Since the CSD crash receiver Robson Rhodes has begun disposing of stock, and some observers suggested that CSD might be sold as a going concern, with a number of parties openly declaring an interest.

The Sparklers deal was signed last Friday (August 21), and Nigel Ruddock of Robson Rhodes also revealed that a sale of stock and assets will be held early in September, although some stock is subject to a surplus claim by CSD creditors.

Pirate Software will be releasing

its four debut titles on September 30. The range will fall into two streams. Pirate Gold will cost £2.99, and Pirate Silver £1.99.

The four titles are as follows: *Trivial Fruit* (C64), *Holiday in Sumeiria* (Spectrum) are the two Pirate Gold items, while the Pirate Silver ones are *Call Me Psycho* and *Super Smashout* (both Spectrum).

Richards' official capacity will be Publishing Manager, although Pirate is described by the company as "masterminded" by him.

New faces at Virgin

VIRGIN Software, the business division of Virgin Games, has announced its first title, to be exhibited at next month's PCW Show, and has also appointed two people to head the new operation.

Collector's Catalogue is a package for indexing, classifying, valuing and producing reports of collections, be it butterflies, records or stamps.

Five other titles are under development, and all six are expected to be on view at next month's show.

Maya Patel has been installed as Virgin Software's Product Development Executive, and

Maya Patel

Paul Latham, formerly manager of Virgin Games, has been appointed general manager for the label. He said: "It is for those people who have suddenly found a PC compatible within their price range but don't know what to do with it other than using it for financial modelling or word processing."

CAD pack
for C64

SUPERSOFT has added to its range of C128 peripherals with a low-cost computer-aided design (CAD) package, called *CAD128*, appropriately enough.

It is designed to be used for designing small printed circuit boards, and can output to any Epson-compatible dot-matrix printer, or Hewlett-Packard-compatible laser printer.

CAD128 costs £49.95 on disc only, and is available from Supersoft, Winchester House, Canning Road, Wealdstone, Harrow, Middlesex HA3 7SJ, telephone 01-861 1166.

The Edge
gets new
sister
label

A NEW arcade games label is on its way from Softek, and will be a sister label to The Edge. Ace will receive its official launch at the PCW Show, although initial titles are expected from the end of August.

"We felt that The Edge's image as a producer of 'games that make you think' such as *Fairlight* was being confused by our entry into the arcade style market with *Shao Lin's Road* and *Shadow Skimmer*," said Softek's managing director Tim Langdell.

"Now The Edge will focus on non-arcade games which primarily aim to be state of the art and innovative entertainment software for both 8-bit and 16-bit micros."

The first Ace titles will be coin-op licenses - *Alien Syndrome*, *Soldier of Light* and *Darius*. These will be followed later in the autumn by *Xecutor*, *Tangent* and *Shockwave*.

Meanwhile forthcoming Edge releases include *Inside Outing*, conversions of *Fairlight II* and *Warlock*, *Mindstone* and *RISK*.

Commodore gets a
lift from 1987 figures

COMMODORE International last week posted encouraging figures for the last quarter of fiscal 1987, turning a 1986 loss of \$127.9 million (about £79 million) into a net profit of \$28.6 million (about £17.6 million).

The turnaround was achieved on lower turnover, down from \$889.3 million (about £549.2 million) to \$806.7 million (about

£498.2 million).

Quarterly figures were equally impressive, with fourth quarter profits at \$2.1 million nearly double the \$1.2 million figure for the corresponding period in 1986. Again, this was achieved on lower turnover, down from \$208.6 million (about £128.8 million) in 1986 to \$190.4 million (about £117.6 million)

this year.

"The fourth quarter of fiscal 1987 marks Commodore's fifth successive quarter of profitability," commented Gould last week. "We achieved this profitability through operating efficiencies implemented without sacrifice to aggressive new product development and marketing."

Prism announces
budget double

TWO labels affiliated to Prism Leisure Corporation - Addictive and Endurance - have announced a clutch of new titles for release on September 1.

Addictive has announced the forthcoming release of the budget version of *Head Coach*, which aims to be "to American Football what *Football Manager* continues to be for soccer fans".

As such, it is fairly similar to *FM*, featuring the picking of a

team to fight through the 12-week season to the Superbowl.

Head Coach will now cost £2.99 for the 48K Spectrum and C64, and £6.99 on Commodore disc.

Meanwhile Endurance has announced the budget re-release of its 1985 title *International Karate*. Budget prices are as follows: £2.99 48K Spectrum, C64, C16, Amstrad CPC and MSX, and £6.99 on Commodore and Amstrad disc.

New
printers
from
Brother

BROTHER has announced a range of new printers which it will be displaying at November's Compec exhibition.

The 2518 - an 18-pin dot matrix printer - can accept any type of stationery, from envelopes to thick card and sticky labels. It has a draft speed of 360 cps (characters per second), and a near-letter quality speed of 75 cps. The 2518 has 12K memory and a seven-colour facility.

Brother will also be displaying the 1724, a 24-pin letter quality dmp. This operates at 216 cps in draft mode, or 72 cps letter quality. The 1724 is compatible with the Epson LQ-1000, Diablo 630 and IBM ProPrinter XL.

Finally, there will be the new HL-8 laser printer, which prints eight pages per minute and has five resident fonts with a further two font cartridge slots.

Further information from: Brother Computer Peripheral Division, Jones & Brother, Shepley Street, Guide Bridge, Audenshaw, Manchester M34 5JD, telephone (061) 330 6531.

Rescue service
for damaged discs

S&S ENTERPRISES has announced the start of its Disk Doctor Service, for rescuing important but inaccessible data.

S&S says that the service will tackle anything, from deleted files and corrupted databases to formatted hard discs and discs that DOS won't recognise.

The snag is that if the service is successful in freeing the data, the charge can be several hundred pounds. But the service is operated on a strict basis of no fix - no fee. S&S claims that it has a 90 per cent success rate, on discs that others have

given up on.

Contact S&S Enterprises, 31 Holloway Lane, Amersham, Bucks HP6 6DJ, telephone (02403) 4201/28095.

Mark Lewis, director of European publishing

Other companies have tried the direct distribution approach and admitted defeat.

So, while EAUK has access to HMV, WH Smith, Laskys, Tandy and Menzies among the major multiples, as well as CTNs, the battle will be largely won or lost on the attempt to get EA product into Woolworth's (hopeful) and Boots (very doubtful).

"Several retailers have said that they cannot take our products at this stage. That's not suggesting that they will or they won't. We will continue and try to show products progressively," says Forrest.

"But we're going to see more people with a greater acceptance of the way we're selling

and Amiga establish themselves, EA will have the lead over UK outfits such as Hewson, which are only now involved in 16-bit software development.

Initially at least, EA will be bringing UK customers up to date with its US catalogue, with simultaneous release in the US, Europe and Japan thereafter. But Mark Lewis, director of European publishing, makes it clear that EA is looking further ahead.

"In five years' time, there will be a dominant interactive machine, and it won't be an ST or an Amiga. We're well positioned to ride the waves of the future," he says.

Lewis is referring to CD-

Electronic Arts – by special delivery

John Brissenden visited Electronic Arts' new European headquarters to hear about the US company's plans for the UK.

THE name Electronic Arts has been cropping up with increasing frequency over the past few months, and the autumn looks set to see the company adopting a much higher profile.

It's certainly not the first time that an American software house has set up here, and has made big bland claims about company philosophy, giving more to the consumer, making computing fun, and so on *ad nauseam*. The bad news is that Electronic Arts is making all those claims as well.

However, there are a number of things about the UK set-up that do make it different.

The most striking thing about the company's new Jeffrey Archer-clean headquarters in Langley, Berkshire, is its size. With 10,000 square feet of warehousing, as well as vast office space set up before next month's official launch, clearly this is a firm with deep pockets.

"We'll have invested £1 million here by the end of December, and we'll be employing 50 people at Langley alone," says John Forrest, director of European distribution.

Electronic Arts claims to be more successful in the US than both its nearest rivals com-

bined, and anticipates 1987 turnover in the United States upwards of \$50 million.

A key element in EA's corporate strategy, and the one which marks the company out from competitors, is its direct distribution methods. Instead of having the product handled by a third party in getting it to retail outlets, EA has a direct sales team.

A company document claims: "The distribution leader gets more attention from key retail customers. He [sic] gets first shot at special promotional opportunities.

"He has more power to get shelf position for unproven new titles. In addition, with better information from a broader portfolio of sales results, he can design better marketing programs, and can spot product trends more quickly".

The direct sales approach has certainly contributed to EA's success in the USA market. But observers will be watching the first few months of the UK operation with interest.

Not only is the company a relatively unknown quantity, but the direct sales method is going to be up against the combined might of the major distributors.

direct to retailers," he adds.

It's not all uphill. The company's main point of interest to the games player is its head start over most UK houses in 16-bit software. The 16-bit market is already established in the US, and PCs and Amigas are already among the most common home micros.

Over here the 16-bit market is just finding its feet. As the ST

based technology, which in the opinion of many will provide the great leap forward in home computing, enabling micros to link up with video and hi-fi in a whole entertainment system.

Lewis reckons the US will adopt this in five years, with Europe not far behind.

For a foretaste of what EA has to offer the UK customer, see pages 16 and 17.

Hooked to the silver screen

It's perhaps surprising more companies haven't produced programs which will put computer-generated captions on video film for the home market. Datasoft's Video Title Shop does just that. Chris Jenkins found it hard going but the results quite pleasing.

Statistics show that market penetration of home computers and video recorders often coincide; in other words, if you've got one it's likely you have the other.

However, apart from fairly expensive video digitisers, and even more expensive Genlock systems which combine video and computer images, there are surprisingly few products which exploit the many possibilities of both computers and videotape.

If you shoot your own home videos on a regular basis, or just hire a video camera for a family wedding or court appearance, *Video Title Shop* will allow you to give your finished tapes a more professional appearance. It's a disc-based package for the Commodore 64 and compatibles which is largely designed for adding caption screens and simple illustrations to video tapes – hooking the computer up to the VCR is pretty straightforward, and is explained with clear examples in the manual.

Unfortunately, despite being copyright 1987, *Video Title Shop* is designed like something out of the ark, with clumsy keyboard controls, limited options and an abysmal jokey manual. Attempting to set all these problems aside, I was pleasantly surprised to find that you can eventually achieve good results with the package – but someone ought to explain to Datasoft that many inexperienced video users might appreciate a more user-friendly approach, or dare one even suggest Wimps?

To create text screens, options are selected using the cursor keys, Commodore key and a string of command keys, or in some cases a joystick. Some of the command keys are ridiculous – Run/Stop to confirm an option selection? A command display and a quick reference card are provided to help you with all the commands – but if the program had been better written, it wouldn't have been necessary.

Each different section of text has to be created as an 'object' with a specific 'pen'

(four are available), font and colour. Text lines are assembled on 'pages' (which can be bigger than the screen), and which are then combined to form 'sequences'.

Needless to say, any of these can be saved to disc, and though there is a

utility (loaded separately) with all the usual facilities; lines, polygons, fills, fill edit, border colour, brush shape and so on. It allows you to use all 16 of the 64's colours; you can then combine a text screen with a graphic screen to create a complete page.

The exciting part (at last) is using the special effects options to create an animated rather than static sequence. You can slide one page over or under another from any direction, place the text across the graphic one letter at a time, have one page push another off the screen, or "fizzle" (fade pixel by pixel) from one page to another.

The demo sequences give you a good idea of what can be achieved by combining these effects. This is really the only aspect of the package which gives it any advantage over an otherwise infinitely superior product such as Rainbird's *Advanced Art Studio*.

I tried very hard to like this package, because the basic idea is good and it offers some facilities which I very much wanted to have available for my own video work.

However, the control systems are poor, the text fonts offered are very unimaginative and the whole thing is well below the standard you would expect.

You can't, for instance, format discs from within the program, or hold more than two fonts in memory at any time, or import graphics from any other art programs (except some obscure American packages which I'm sure no-one uses over here). The potential for a truly useful, ingenious product is there, but someone appears to have slipped up on the 'ease of use' factor. Overall a case of nice video – shame about the software.

memory limit on the number of pages which can be stored at once, judicious editing of your videotape makes this fairly irrelevant.

Any four of the Commodore's 16 colours can be used to create text lines in font sizes from 8 x 8 to 64 x 64 pixels. These can be centred, left or right justified, copied, and moved around the screen. Text frames should then be saved to disc before you go on to design the graphic background for your titles.

Graphic Painter is a simple little drawing

THE ULTIMATE
HEAD TO HEAD
CONFLICT

Screen shots are taken from the C64 version

Left: *Chessmaster 2000*, digitised voices and 3D graphics. Below: *Arctic Fox*, now being converted to the Spectrum and Amstrad CPCs.

including enemy tanks, missile launchers, mines, communications towers and some superbly animated flying machines.

Versions will be coming on Spectrum and Amstrad cassette, and on Amstrad disc.

Electronic Arts has some excellent Amiga software coming too. Foremost among these is *Chessmaster 2000*, with digitised voice, training modes, opening book, variable difficulty levels and the graphics are a treat in 3D.

There's also *Earl Weaver Baseball*. Old Earl, apparently, is one of the highest ranking baseball coaches, and the game features both coaching strategy and arcade action, with hints, tutorials and admonitions from the great man himself.

Commodore 64 owners are not excluded from the new releases with two offerings, *EOS* and *Legacy of the Ancients*.

Games without frontiers

Peter Worlock, a long time Electronic Arts fan, samples some of its new UK titles.

There is a body of opinion that says Electronic Arts is the best games publisher anywhere in the world.

To many British computer owners, especially users of British machines like Amstrads and Spectrums, that may sound like an outrageously controversial statement.

However, the imminent launch of Electronic Arts on to the UK software scene is certain to win the company a horde of new fans – especially among games players who want more than mindless action.

Not that the games are unstintingly cerebral. It's just that Electronic Arts specialises in games that require a good deal of thought and strategic planning.

Some of its earlier products – especially on the Commodore 64 – will be familiar to some *Popular* readers. Games like *The Bard's Tale*, probably the best fantasy role-playing game to date; *Archon*, a combination of chess and arcade action; and *Seven Cities of Gold* and *Heart of Africa*, unusual combinations of historical simulation and graphic adventure.

Among the torrent of new releases on the way in September, the big-selling American machines continue to predominate: IBM PC, Commodore 64 and Amiga. But for the first time, Spectrum and Amstrad owners will be able to form their own judgements on the quality of Electronic Arts' games.

First of these conversions will be *Arctic Fox* a 3D tank simulator set in the polar wastes.

Animation is slick with solid filled wire-frame graphics showing mountains, crevasses, and a host of alien hardware

Legacy is a fantasy role-playing game, a sort of combination of the *Ultima* series and *The Bard's Tale*. The game is enormous with literally thousands of locations to explore, monsters to fight, puzzles to solve and treasures to win.

There are some excellent spot graphics, but I found the presentation a bit disappointing (everyone has their off days).

EOS is a different story. This is a marvelously complex game of space exploration.

There are a number of scenarios of increasing difficulty, beginning with the

Amiga

<i>Chessmaster 2000</i>	£24.95
<i>Earl Weaver Baseball</i>	£24.95
<i>Deluxe Paint II</i>	£69.95

Amstrad CPC

------------------------------	-------

relatively simple task of building a profitable space station in Earth orbit, advancing to the development of sophisticated stations such as lunar mining and ore processing stations, space hospitals, and eventually mobile stations which develop colonies on other planets and moons.

The game is brilliantly executed, with satellite news broadcasts, detailed, high-tech graphics, and the option of playing against up to three opponents, either hu-

man or computer-controlled.

Two goodies for Atari ST owners are the incomparable *Bard's Tale*, and *Music Construction Set*.

But probably the most favoured group of users are those owning IBM PCs, and clones like the Amstrad PC1512. If you're looking for a break from spreadsheets and databases, Electronic Arts has a feast

awaiting. Leading the field is *Chuck Yeager's Advanced Flight Trainer*, a flight simulator blessed by Mr Right Stuff himself with a host of options.

Fly 14 different planes, from a Sopwith Camel, a Spitfire and a P-51 Mustang, to the X-1 rocket ship, and modern F-16 and F-18 fighter/bombers.

The main feature, apart from the great

Above: Earl Weaver Baseball, with hints, tutorials and admonitions from the great man himself.

Above: Chuck Yeager, Mr Right Stuff's Flight Trainer. Left: Legacy of the Ancients, a fantasy role playing game.

graphics, is a training mode in which Yeager teaches you to fly.

Not better than SubLogic's *Flight Sim II*... merely different. Serious would-be pilots will want both.

Also on the IBM list, *Chessmaster 2000*, *World Tour Golf*, and *The Bard's Tale*.

Nowhere in the catalogue will you find *Uridium* clones, or platforms and ladders games – the kind of fast action stuff at which British programmers excel. What you will find are probably the best games of their kind.

All in all, Electronic Arts' entry into the UK market is like Christmas come early for lovers of serious computer entertainment.

PROGRAMMING: FEATURE

So far, I've looked at various features of the Lisp language but not at any particular applications. Lisp is mainly used in artificial intelligence programming (A1) and is suited to this because of the way it handles information. One aspect of A1 is expert systems, and the simplest of these is the guessing program "what is it?"

This program asks questions about a subject until a conclusion is arrived at. The answers can be yes or no and the questions are held in a binary tree. Fig 1 shows a binary tree, each list contains a question and each element of the list points to the next question, depending on the answer. Since the only answers are yes and no, there can be only two branches hence the name binary tree.

The car or first element in each list is the question, eg, if the first element were big,

```
(setq top (a b))
```

Then attach another two lists to each of the elements:

```
(setq a (c d))
(setq b (e f)) (see figure one)
```

The last four items need to be set to *t* so that atom can be used to find them so:

```
(setq c t)
(setq d t)
(setq e t)
(setq f t)
```

Now try:

```
(atom top) Atom is a test to see if its argument is an atom (ie, not a list), and if so, returns true.
```

This obviously gives nil since *top* is a list, (*atom (car top)*) gives true, however, this is

not surprising since (*car top*) is *a* and *a* is an atom. To find out if *a* points to a list, (*atom (eval (car top))*) is used.

This evaluates the car of top, ie, *a*, and gives the correct result nil since *a* points to a list and not an atom.

Moving down the tree one layer, the same test can be tried on the list *a* and gives the result true since *c* points to *t* which is an atom (*try (atom t)*). The test (*atom (eval (car m))*) where *m* is a list can therefore be used to find the end of the tree for yes's.

For no's, the situation is slightly different since the cdr of a list is also a list. To see if it points to the atom *t*, (*eval (car (cdr m))*) must be used. The car of the cdr, ie, the first of the remainder can also be written *cadr* so, (*eval (cadr m)*) is used for no's.

The guess function is recursive, ie, it calls

LISP APPLICATIONS

In the final part of our series on Lisp, Kenn Garroch looks at some practical applications of the language.

the program asks 'is it big?'. If the reply is yes, then the list pointed to by 'big' is used in the next question.

If the answer is no, the last element in the list (or other, since there are only two) points to the no list, the first element of which holds the next question. Since the 'no' pointer is not used as a question, I have arbitrarily used the same name as before but just stuck an 'x' on the end (plus there are not too many English words ending in x).

The main program therefore has to move down the tree picking out the appropriate questions, depending on whether the answer is yes or no. The important point is reached at the bottom of the tree when there are no more questions.

There are two cases: one, when a line of questioning comes up against a no, and there are no more questions to be asked, and secondly, when the questioning comes to a yes and there are no more questions.

In the first case, the head element in the list points to *t*, ie, it has no list attached to it, just the atom *t* (true). Similarly, the second case comes up against the last element in the list which also points to *t*. For instance, take the list top, ie:

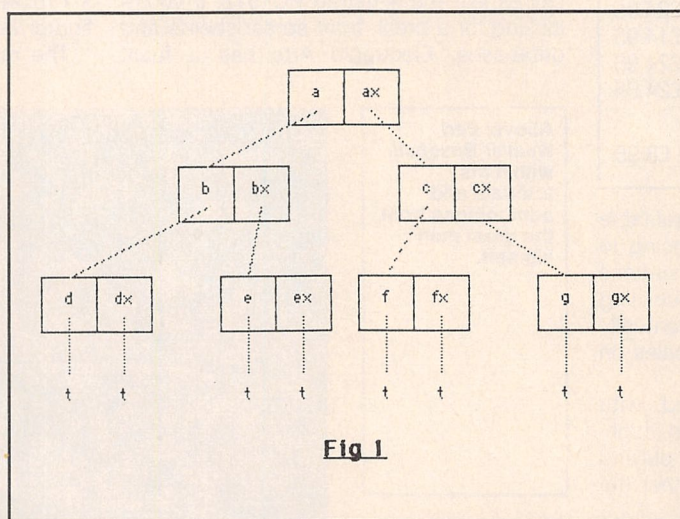

Fig 1

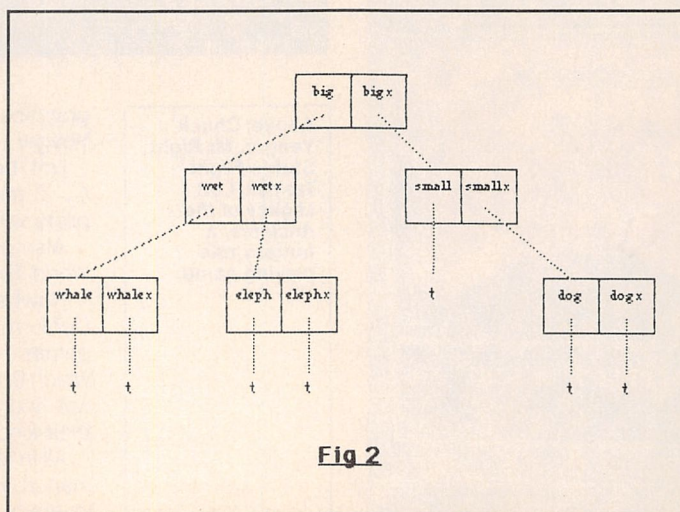

Fig 2

itself. The recursive aspect of Lisp always comes in useful in situations like this since the same process is happening over and over, only the arguments change. When neither y or n has been answered, *Huh?* is printed and guess is called again with the same argument.

On finding that there is no more tree left, more information can be added. The functions *newt* and *newf* add yes and no branches respectively. In the yes case, more description is asked for, ie, 'what kind of ... is it?'

Note the use of 1 in the print statements. This causes Lisp to ignore the fact that there is a space being printed; in fact, it is needed when any non-alphanumeric is printed, otherwise Lisp will try and use it as a function, or treat space in the normal way as a separator. *newf* is used when the function cannot get a result, ie, n is the reply, and the end of the tree is reached. 'What is it?' asks for a new object that can be added into the structure.

To start the program off, the new function is needed to set up the first pointers and questions. For example, the first list to be used is called top, and the question is big. So (*new top big*) sets up top to point to the list (*big bigx*) and sets *big* and *bigx*

to point to atoms, in this case *t*.

Now, (*guess top*) starts off with the question, 'is it big?', to which there are two answers, y or n. In the first case, it will then ask what kind of big is it so (regarding fig 2) an answer could be wet.

After the new item has been entered, *guess* finishes and can be restarted with (*guess top*). Now, 'is it big?' answered with y gives 'is it wet?' and if yes is the answer, what kind of wet is it will be asked.

The layout in fig 2 shows how the tree grows. Yes's go to the left and no's go to the right. One thing to notice about the *guess* function is that it can be short circuited by repeating an answer. In case of fig 2, answering big instead of whale causes problems since it resets big to point to the atom *t*.

This can be useful in that branches can be joined together but it can cause difficulties more often than not. A search through the oblist would solve the problem but would slow the program down.

There are a number of refinements that can be made to *guess*, first of all, only single words can be entered as replies so, the English syntax sometimes seems a little weird.

A more sophisticated version could be written using maybe (or don't know) as a possible answer. The results would then depend on previous answers and probabilities (a true expert system).

```
(de guess (m)
  (princ 'is it! )
  (print (car m))
  (setq ip (read))
  (cond ((equal ip 'y)
    (cond ((atom (eval (car m))) (newf m))
      (t (guess (eval (car m))))))
    ((equal ip 'n)
    (cond ((atom (eval (cadr m))) (newf m))
      (t (guess (eval (car (cdr m))))))
    (t (print 'Huh!?) (guess m))))

(de newf (lst)
  (princ 'what! kind of! )
  (prin (car lst))
  (princ 'is it!?)
  (setq ip (read))
  (set (car lst) (list ip (addx ip)))
  (set ip t)
  (set (addx ip) t))

(de newf (lst)
  (princ 'What! is it!?)
  (setq ip (read))
  (set (cadr lst) (list ip (addx ip)))
  (set ip t)
  (set (addx ip) t))

(de new (name first)
  (set name (list first (addx first)))
  (set first t)
  (set (addx first) t))

(de addx (name)
  (compress (list name 'x)))
```

Custom RSX Manager

Simon T Goodwin

Individual RSX commands are published regularly in *Popular Computing Weekly*, but it is often very difficult to merge them together into one machine code program to use in your own programs. This program allows you to do just that. It allows the user to create a database of RSX's from which any number of commands can be selected to create a customised Basic extension package. To store the data it uses an extra 16K bank of Ram, thus making it compatible only with the CPC 6128 or an expanded 464/664. This is a very complex program which will probably only be of use to people with a knowledge of machine code.

An RSX command can be separated into two parts: the RSX table and the actual machine code program. This machine code section must be relocatable, or else it cannot be placed into the database. The database ignores the RSX table. The user must make a note of the memory address and the length of the machine code section (not the RSX table) before loading a file into the database.

Menu options

When the program is run, a menu containing nine options is displayed. To select an option use the up and down cursor keys and the Copy key. Of these options Disc/Tape Catalogue and Exit program are self-explanatory. There now follows an explanation of the other options.

The Load Machine Code Data option allows the user to load in a file containing one or more RSX commands. The file is loaded to the address specified by its header. Files should not be loaded in below

address 13000. You do not have to worry about load files sequentially. Once an RSX routine has been stored (using the following option) you can forget about the original code. Once a file is in memory RSX's can be "plucked" from it using the Store RSX Routine option. To place an RSX into the database the user must specify the name of the RSX (this need not be the same name as the original RSX), and the address and length of its machine code section. Ordinary machine code programs can also be transformed into RSX's with this option. The database can hold up to 16K of machine code routines. Once an RSX has been entered into the database a hex dump of it can be displayed using the Hex Dump or RSX Routine option.

This two part listing is available on tape (£3) or disc (£5.50) from 41 Fountains Drive, Acklam, Middlesbrough, Cleveland TS5 7LW.

PROGRAMMING: COMMODORE 64

Pointer Driver

Iain Murray

This short machine code interrupt routine forms the basis of a mouse driven pointer system. It creates a pointer

which appears on the screen, and can be moved about under control of a NEOS (or compatible) mouse, within the boundaries of the screen. Once the pointer system is running, other software can be loaded, and the pointer will still work as long as the interrupt vector is not changed.

The mouse pointer is sprite 0, and its co-ordinates can be read as usual at 53248 (\$D000) for X and 53249 (\$D001) for Y. Pointer colour is stored at 53287 (\$D027). The routine also provides data on low-res screen co-ordinates on the 40x25 text screen.

These are at 53000 (\$CF08) for X and 53001 (\$CF09) for Y. The on/off condition of the two mouse buttons can be read at 53002 (\$CF0A) and 53003 (\$CF0B) for the left and right buttons respectively.

The machine code occupies memory from 52224 (\$CC00) to 53005 (\$CF0D), leaving the 3K block from 49152 (\$C000) to 52223 (\$CBFF) free for your own use.

Remember that the NEOS mouse can be used like a joystick if it is plugged in with the left mouse button held down. However, this program allows full freedom, taking advantage of the mouse's full capabilities.

Sprite Animator

Tim Fox

This suite of programs will allow you to define sprites and then animate them. Type in listing 1 and save it with *SAVE "SPRITE" C00 CDD. Then, enter listing 2, the sprite definition program, and save it.

To define your sprite, enter PAGE=&1D00 and CHAIN the program. The controls are self explanatory but, the cursor keys move the cursor around, a number key or letter A-F fills the present grid square with that colour (in hex).

S saves a sprite, once you press a number for the filename.

V and then a number or letter A-F will fill the present vertical column with that colour.

H will do the same except on a horizontal basis. O for help on the controls.

Escape will bring you back to the grid.

W and then a number or letter A-F will fill the entire grid in that colour.

P will print the sprite in actual size.

More details and the rest of the listings next week.

PROGRAMMING: ATARI XL/XE

ADS

Adam Newby

ADS is an assembler and disassembler system that will be presented over three weeks.

Type in the program and save it with CSAVE. Do not type the TRAP statements until you are sure the program works. On running the program, the prompts, "Max-

number of lines?" and "Max number of labels?" will appear. This is to save memory space - the less lines, the less memory is taken up by variables.

After the computer has finished its initialisation, you will get the prompt, "Press: 1 for assembler, 2 for disassembler." Pressing 1 will display the assembler menu, which gives the following functions:

1 - Write new program. This is where you type in your assembly language program. Type the line number (this doesn't have to be a number, any kind of symbol will do), then press Return. Now type the instruc-

tion, then press Return again. Next type the operand and press Return once more. If there is no operand, just press Return. When you have finished typing in your program, type as the instruction. The menu will be displayed again.

Instructions should be entered in the following way:

(a) Instructions using immediate addressing have a "#" suffix, so LDA (immediate) is LDA#.

(b) Instructions using absolute, relative or implied addressing have no suffix, so STX

continued on page 24 ►

PROGRAMMING: ATARI XL/XE

◀ continued from page 23

(absolute) is just STX, BEQ (relative) is just BEQ and DEX (implied) is just DEX.

(c) Instructions using zero page addressing have a Z suffix, so ADC (zero page) is ADCZ.

(d) Instructions using indexed addressing have a full stop then the index register. If the instruction is indirect indexed, then an I is also added before the index register, and

if the instruction is zero page indexed, then a Z is also added before the index register. So LDA (absolute), LDA.X, LDA (indirect), is LDAI.Y and STA (zero page),X is STAZ.X.

(e) With jumps and branches, the operand is the line number to which the jump or branch goes, with one exception: with indirect jump (JMPL), the operand is the address used. A D S has two extra instructions, JMPOUT and JSROUT, with which

you specify an address and not a line number to which the JMP or JSR goes. This is useful for calling ROM routines. A D S also has two special instructions, *BYTE and *WORD. These create in memory the value specified in the operand, so *BYTE 255 puts 255 in the next memory location and *WORD 65535 puts 65535 in LSB,MSB format in the next two memory locations.

More details next week.

BE A RAT!

Red Rat Software have successfully published Atari programs for over 18 months. Now we are ready for expansion and require quality games for 16-bit computers.

If you program for Amiga or Atari ST, send your completed or near completed program to:

**Don Rigby
Red Rat Software Ltd
11/15 Fennel Street
Manchester M4 3DU
Telephone: 061-834 4941**

We will quickly assess your work and give you a no-nonsense decision, with excellent royalties on everything we publish.

Red Rat

XPoke

Alan Crawford

One of the problems of accessing the extra bank of 64K of Ram on the 130XE, is that you must switch in the correct bank and then remember that it can only be accessed in the 16-32K area.

This routine simplifies that by providing USR functions that allow you to access the banked memory as though it were a continuous block of 64K. The syntax is A=USR(X-POKE, ADDRESS, NO.) where A is a dummy variable. To peek use A=USR(XPEEK, ADDRESS) to return the value in A.

```

Attention!

Unfortunately due to the sheer volume of submissions our returns department has been unable to cope satisfactorily. So, from now on we are requesting that you include a suitable stamped addressed envelope for return of your submission. Not enclosing a suitable SAE will mean that your program will not be returned. You have been warned.

The beneficial side of this system is that

90% of submissions will be returned within one week. A small price to pay for such a service I'm sure you'll agree.

With regards to future submissions we are looking for articles on programming in general, utility programs and applications software and lastly, good games. Here are a few types of program we don't want: Educational, hangman, pools predictors, mastermind, flashing borders, bank ac-

counts, disc catalogues and clocks.

If you can't get a program listing in the magazine to work ring in to see whether it was faulty rather than writing. If there were problems then we'd let you know. Corrections normally appear a couple of weeks later. Thanks.

No effect on the printer

Christopher Adams, of Moseley, Birmingham, writes:

Q I recently bought a Memotech RS232 serial interface for my veteran ZX81. The idea was to link the computer with a Brother HR5 printer, but although the interface's Rom routines produce the expected screen displays, trying to transmit has no effect on the printer and frequently hangs up the computer.

The interface has to be initialised by defining a variable P\$ with codes to set such things as parity, baud rate, stops bits, etc. A colleague, who works in telecommunications, read both printer and interface manuals and suggested the formula $P\$ = "00010110,01101000"$. This gives 300 baud, even parity, one stop bit, 8-bit word-length, and a few other controls and commands. As far as I can tell, the printer is set up to cope with this arrangement, but still no joy.

One thing I've noticed is that the printer end connector is given in the manual as 3M Part No 3635, but the one supplied is 3634 – could this be the trouble?

A This sounds more like a connection problem than anything else. RS232s when used with printers usually need the following lines:

TX: Transmit from the computer to RX (receive) on the printer.
CTS: Clear to send on the computer to either RTS (request to send) or DTR (data terminal ready).

Signal Ground on the computer to signal ground on the printer.

If the CTS line is connected to

the wrong line on the printer, the computer will sit around waiting for a signal that tells it the printer is ready to receive. This may be the case in your situation.

The thing to do is look in the interface's manual for a pin out of the connector. Check that TX and ground are connected correctly, and then check the CTS. If the HR5 has a 25 way D connector, then try CTS connected to pin 4 or pin 20 (RTS and DTR). If this doesn't work, try placing 5V on the CTS (interface end) so that the printer always appears ready.

It is possible that there are other connections that need setting (connecting to 0 or 5V) so that the interface recognises the printer. You will have to look in the manual and find which are inputs, and then experiment.

One way of checking whether the interface is operating correctly is to use a null modem (I think it's called this). This gadget simply feeds RX to TX, RTS to CTS. Transmitting via the interface simply sends the data back, proving that it is in working order. With the correct plug, it is easily possible to make one of these.

Making waves on the ST

Tom Evans of London W11, writes:

Q I was wondering, if you had the correct software and microphone, would it be possible to use a computer as an oscilloscope, creating waveforms in the same style as viewed on a purpose-built CRO? I own an Atari ST.

A The answer is yes, to a certain extent. There are certain disadvantages, and certain advantages to using a computer in this way.

The hardware necessary is an Analogue to Digital Converter (ADC), and some interface circuitry, plus an amplifier for the microphone signal. An ADC is a gadget that takes variable voltage signals, and converts them into digital numbers, generally four, six, eight or 12 bit ones depending on the accuracy needed.

Inside an ADC are a set of comparators each with two inputs. When one input has a higher voltage than the other

input, the output of the comparator goes high, ie, gives a 1. In a fast ADC, there are a lot of comparators, each with a successively higher standard voltage connected to one of its inputs. The other input goes to the incoming voltage.

As the incoming voltage changes, the number of comparators that are on changes. The number that are on are decoded to give a binary number representing the analogue input voltage. The problem is that to convert a voltage into an 8-bit number (256 values), 256 comparators are needed which is a lot to fit on one chip.

The way around this is to use one comparator and change the standard voltage at a set rate, ie, scan it through all possible values. As long as this scan is performed faster than the incoming voltage is changing, a fairly accurate conversion can be performed. The main differences between the two is that the first is fast, but expensive, the second slow and cheap.

Which kind is used depends on the maximum frequency of the analogue signal. There are some ADCs that use a mixture of both methods to achieve reasonable speed at a reasonable price.

Since it takes a certain amount of time for the conversion to be done, the analogue signal is split up into a series of numbers at a set rate. Each of the conversions is known as a sample as it represents the value of the analogue voltage at a certain time. If the incoming voltage changes faster than the samples can be taken, the resulting series of numbers do not represent the analogue signal accurately, and in extreme cases are complete gibberish.

The rule is that the sample frequency (samples per sec) should be at least twice the frequency of the incoming signal to get any reasonable representation. In fact, it is better to go for three to four times.

The disadvantage of a computer used as a CRO (Cathode Ray Oscilloscope) is that its bandwidth is limited by the speed of the ADC, and by the speed that it can read the data coming from it.

Audio signals usually lie in the frequency range 20–20000Hz (1Hz is 1 cycle per sec) so the sampling frequency needs to be at least 40000Hz which means that the ADC should have a conversion time of 25μ seconds or even better 12.5μ seconds to give 80KHz.

Fortunately Maplin stocks the ADC0820CCN which boasts a conversion time of 1.5μs for 8 bits, which should allow frequencies of up to 300KHz to be sampled. This ADC is also quite easy to attach to a computer since it has an 8 bit data bus that can be directly connected to a parallel computer port.

Tied up with ribbons

S Hazelgrove, of Leeds, Yorkshire, writes:

Q A problem has developed with the ribbons on my printer, a five year old Star BP510. When the ribbon reaches the end of its travel, an eyelet toggles a switch and the ribbon reverses direction.

The problem is that the ribbon does not reverse straight away. It stands still for eight or nine passes of the print head. The result is that each end of the ribbon wears very quickly compared to the rest. Is there any way to overcome the problem?

A I presume that the printer did not always do this, so the fault must be to do with either a mechanical fault or muck. The latter seems most likely since the ribbon reverses eventually.

Try examining the mechanics of the process a little more closely and see if there are any points that need oiling or cleaning. Printers pick up quite a lot of dust over the years and they need a good clean every now and again.

Apart from this, I don't know what to suggest, perhaps some other readers have had this problem and overcome it? If so, write to Peek and Poke and I will print your suggestions.

Is there anything about your computer you don't understand, and which everyone else seems to take for granted? Whatever your problem Peek it to Kenn Garroch and every week he will Poke back as many answers as he can. The address is Peek & Poke, PCW, 12-13 Little Newport Street, London WC2H 7PP.

Constant interruption

Gerry Holmes, of Gwent, writes:

Q I own an Atari ST. Could you tell me how to make, or the principle of, interrupt driven music? Also, how I could design my own font from assembly language?

A Interrupt driven music is simply a program that plays the sound chip using a predefined music score, and gets its timing from an interrupt. Since music nearly always has a set tempo, a regular beat must be maintained. The most regular beat, easily available, on the ST is the Vertical Blank Interrupt (VBI).

The music program is jumped to every time a VBI occurs, and picks up the next notes to be played. These are sent to the sound chip, the interrupt ends, and the main program is carried on.

The ST's VBI routine is quite important to the machine, since it performs such things as checking on the screen resolution, updating the colour palette, and keeping track of the discs, etc. Because of all of these functions, it cannot be simply redirected to run a music program. Instead, the music routine has to be placed in the queue along with the other functions.

The queue holds the start addresses of all the current VBI routines, with a zero address meaning none. To insert a new routine, an empty space (zero address) in the queue must be found, and the music program address inserted.

Normally, there is space in the queue for eight addresses, not all of which are normally used. If they are, things get a little complicated but don't worry about this, there is generally a space left on the standard machine.

The following program inserts the address of the music routine into the queue using the `setvbl` subroutine, music is the interrupt routine that drives the sound chip. I have given a simplified version of a music routine, which goes blip . . blip . . blip. You will need to establish some kind of protocol in the data so that not all of the registers (envelopes, etc) need be loaded every time. To turn off the interrupt use `rstvbl`.

A couple of things to note are that, when in an interrupt routine, the ST is in supervisor mode automatically, and the sound chip can be addressed directly. The other thing is that the BIOS Trap commands don't work very well from within interrupt routines, so the sound chip has to be accessed directly. This is done from the two addresses \$FF8800, which is the register select/register read location, and \$FF8802 which is register write.

The sound chip has 16 internal registers which, unfortunately, have to be accessed by the roundabout method of sending the reg num to \$FF8800 and then the data for that register to \$FF8802. Since some I/O is attached to the sound chip, the mixer should be accessed to the way shown in the program, ie, read it, set or reset the bits you need, and then write it back. This gets around any disc problems that might occur.

Designing fonts on the ST is quite a complex business, and to explain it would take up a lot of space. The best thing to do is obtain the book *The Anatomy of the Atari ST* from First Publishing, 20B Horseshoe Park, Horseshoe Road, Pangbourne, Berks.

Have a look at the A-line 8 call, which should give you some idea. In the meantime, I'll give the subject some thought and see if I can represent it in a simpler fashion at a later date. Sorry I can't be more helpful at the moment.

Music demo program.

Return to sender? Address unknown?

Fed up with being told it's 'in the post'? Want a quick word with someone who's busy on their modem? David Wallin describes the various types of mailbox available on Prestel.

Everyone on Prestel knows that page 77 is a standard blank page; in fact, there are three types of this page available. There is the greeting type which is basically an electronic greeting card, with room for just the recipients mailbox number and your signature (occasionally there is also a blank line or two for a short message as well).

The second type is a standard page. These are basically 'blank forms' which can be filled in and sent to another Prestel user.

a # at the end of a line and others don't. It's essential to ensure that if #es is needed or they are inserted, and if not they are it is omitted.

With most mailbox numbers, when you enter the recipient's mailbox number, their name is echoed back for you to check. A newish mailbox frame for longer messages does not include this and therefore it is vital to check that you have the mailbox number correct.

Finally, there is one interesting point I've

type this and insert someone else's mailbox number. Sneaky perhaps, but it's by no means illegal and your friends won't half get a shock when a mailbox with the words MICROMOUSE across the top arrives!

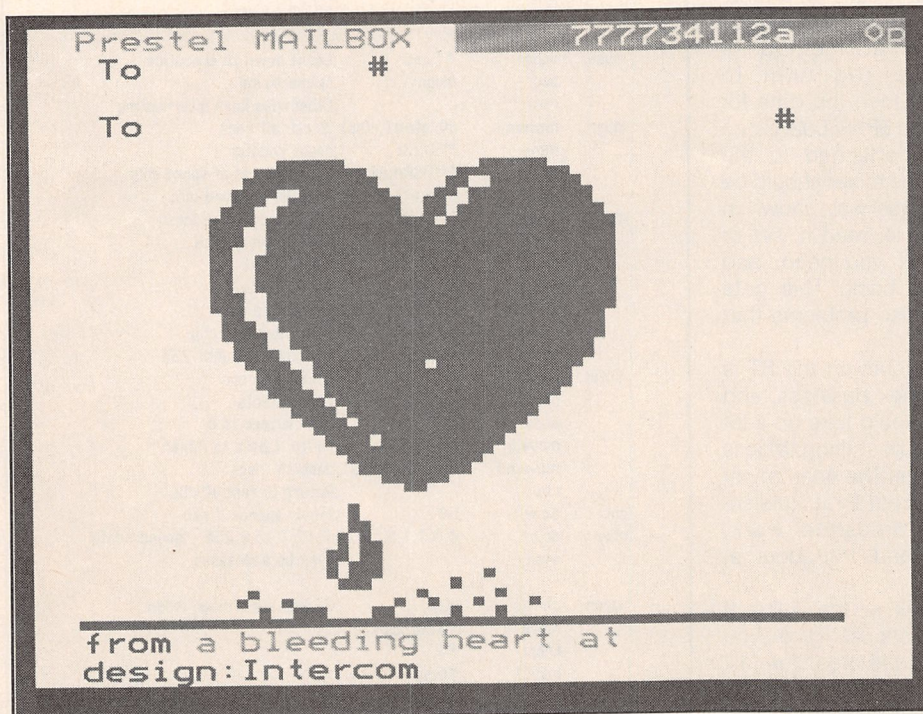

Some of the more common 'blank' mailbox pages

Blank	77
Mailbox	84, 82
Address	89
Oi	7774024
Memo	78
Micromouse	77748571
Long	83
Special	74
Advert	71
Pride	7777672
GugBox	77743701
Patterns	72, 68
Titled	78
Letter	79
Filebox	85
Invisible	86
Bizznet	77748581
Double	73

Invisible page

The invisible page is an odd one, and you will only be able to view its contents if your software has a 'reveal' facility. Do not send an invisible message to someone without checking to find out if they have a reveal facility on their software. If they haven't, you've sent a message secret even to the recipient!

Colour and graphics on Prestel mailboxes are nice, but the messages have to be incredibly short.

(Such as "I rang you at ... and you were out").

There are many standard pages which is fine if you know where to find them, but often, sending a short 77 would be quicker.

The massive list of standard pages can be reached from the mailbox index on page seven.

Then there is the blank page. There aren't many of these since they include very little. There are a couple of lines of header on most with room for a message. One or two have patterns around the text and there are some with flower/animal motifs on them. One point to note when sending a mailbox is the line end. Some pages require

discovered while looking around the Prestel system. Most areas have a talk-back section. This can be one of two things. Either a *Response Frame* or a mailbox page. The response frame does not need a mailbox number to be inserted and when sent goes to the correct person.

Designer mailbox

However, probably to save money, many sections use a specially designed mailbox page with the recipient's (ie, the editor of the area of Prestel) mailbox number already inserted. You just press # to 'agree' that the number is correct. You can however over-

"Do not send an invisible message ... without checking ... they have a reveal facility. Or you've sent a message secret even to the recipient!"

I had used Telecom Gold for about six months before I joined Micronet and, being used to Gold's facilities, the messaging on Prestel came as quite a let down.

This is due to the restrictions of the Viewdata screen. However, Prestel have recently installed a similar system to theirs abroad, but it has most of the mailbox 'problems' sorted out.

Auto reply

Once the system has been fully tested abroad and is bug-free, it will be brought over here to replace the current system. So in the future we should see a greatly improved mailbox system on Prestel. Things like longer messages and auto-reply will be available — things that Telecom Gold already has.

You may wonder why the two should be any different. Both are run by BT, but were originally designed for different purposes, Prestel as an information service and Gold a mailbox one. Both have now spread into each other's territory.

Prestel offers mailbox and Gold (Micro-link) has teleshopping, telebooking, news

and other 'information' areas. I advise a mailbox on each system to get the best of both worlds.

For a free brochure on joining Gold with the registration fee waived mailbox me on 819991214 or write to me at *Popular Computing Weekly*, 12-13 Little Newport Street, London WC2H 7PP.

PROGRAMMERS!

Sounds of America

Mark Jenkins finds that much of the new music software is coming from the USA. However, while we wait for a UK distribution agreement, it's possible to obtain the packages from the companies direct.

The USA continues to turn out music software faster than UK importers can take it on, and there are still many US companies manufacturing exciting-looking packages which have little or no exposure over here.

One such is Compu-Mates, which will hopefully follow in the footsteps of Sonus and start up a UK operation before long. In the meantime, it's easy enough to contact the company in the US, and they'll be happy to send you a catalogue which contains quite a few products unobtainable elsewhere.

For example, the DW8000 *Synthdroid* is one of the few available editors for the Korg DW8000/EX8000, and in the case of the latter unit, the keyboardless expander ver-

Also on the upmarket side, Compu-Mates has a Korg DSS-1 editor which will handle the keyboard's synth and sample parameters as well as additive synthesis routines. Again, several artificial intelligence routines are included to help in the creation of new sounds.

On the sequencer side, Compu-Mates offers *Final Trak*, which has up to 128 tracks, Midi filtering, cut and paste facilities, system exclusive patch dump routines and much more. Editing facilities are apparently highly advanced – you can remove notes played by the right hand without touching notes played by the left hand, for instance – and there's a tunable metronome which can be sent out over a Midi channel, switchable Midi Out/Thru, and an option of using the *Final Score* transcription package.

Final Score will display any sequence in conventional musical notation, offering different musical font styles, cut and paste, alternative colours and so on, and you can enter notes on the screen and play them back as Midi sequences.

Brain into gear

On the hardware side, Compu-Mates offer the Midi Patch Brain which switches from eight to 16 inputs and eight to 16 outputs, syncs to tape and had an optional remote control. There's also going to be a SMPTE Brain which will handle all sorts of time codes and tape sync as well, plus a package called GenPedals, which allows you to use up to eight volume pedals, modulation wheels, faders, breath controllers or other inputs, each assignable to any Midi parameter in up to eight setups which can be arranged in 50 different sequences accessible through a footswitch. Handy for live performances!

On to drum machines, and Compu-Mates has a DrumDroid for the Kawai R100, which is reputedly a very good-value machine, and velocity, level, pan and tune can all be programmed and stored. All 24 drum sounds rather than a choice of eight are made accessible from the micro's keys and you can play the last sound at any pitch using the fourth row of keys on the micro.

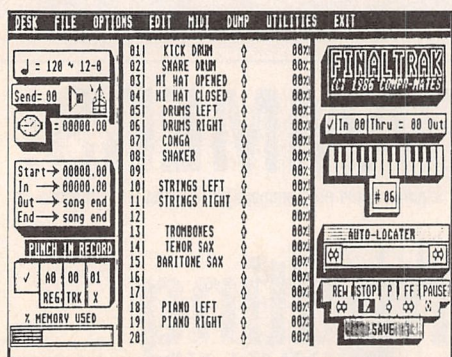

Artificial intelligence routines are also included to generate fills and new patterns, and it's possible to map the drum sounds to a synth keyboard layout.

Prices for the Compu-Mates range in the US seem very reasonable, starting at

£79.95 about £50–£55 for the DW8000 *Synthdroid* and going up to \$199.95 (£130) for *Final Trak*. There's also a *Synthdroid* for the Akai S900 Sampler in the offing – that one should cost around \$129.95 (£85–£90). Compu-Mates also offers a list of hardware updates and add-ons for the 8-bit XE and XL Ataris, although most of its software runs only on the ST.

While on the subject of the ST, Tigress Designs tells me that the colour version of its very successful *Iconix* sequencer is now almost ready.

The original package was by far the most friendly I've seen to date for the ST, and Tigress has released an enhanced version which irons out a few bugs in the Midi clock and timing resolution areas.

Synthdroid

sion of this powerful analogue synth, it could be invaluable.

Synthdroid uses several windows to display the synth's filter envelope, amplifier envelope, and delay line parameters, and fits most of the other parameters on a single page. Touch sensitivity parameters are also included, and you can fit 20,132 patches on a double-sided, double density disc.

It's claimed that the delay editor page allows you to create effects not otherwise available on the synth itself, which is unusual, while the joystick can be used to give a variable amount of sustain.

There's a similar package for the Kawai K3 synth called *K3PO+* which stores 17,800 patches or 5,800 user waveforms on a disc, and a Casio CZ editor with 'artificial intelligence' patch creation facilities. For the more upmarket user there are editors for the Oberheim Matrix 6 and Matrix 6R module, and the Kawai K5 (which isn't available yet in the UK) already has a Compu-Mates editor.

Final Trak

Tigress is now looking for new programmers to work on music products, so if you are familiar with the ST, with Midi, and with development languages such as C, give the company a call.

Back to the world of 8-bits with the BBC B. Apparently there's some confusion as to the state of the add-ons market at the moment, so just to clarify; we published a review of the Hybrid Technology Music 5000 (the updated Music 500) a couple of months ago, but have not yet reviewed the Peartree Music 7000 (now renamed the Music 87) since it hasn't been released yet. However, it has been demonstrated at the Acorn User Show, and we'll be running a full review as soon as possible.

Compu-Mates, 8621 Wilshire Blvd, 177 Beverly Hills, CA 90211 USA, (0101) 213-271 7410.

Tigress Designs, 25 Burmester Road, London SW17 0JL, 01-946 7870.

AMSTAT Modular Statistics and Mathematics Package

MARKETED BY **S. C. COLEMAN**

Available for BOTH PCW AND CPC ranges ★ ★ ★ New Amstat 7

AMSTAT 1 - means, standard deviations, variance, skew, kurtosis, 1-sample, 2-sample, and paired t-tests, 1-way AOV with single and multiple confidence intervals, 2-way AOV, correlations, regressions, histograms, scattergrams, transformations, file store and retrieve, output to wordprocessor file, manual. Flexible variables and observations to a total of 500 (+) data points.

AMSTAT 2 - 27 nonparametric tests in 4 programs providing a "complete Siegel". Binomial, Chi-square (3), Kolmogorov-Smirnov (2), Runs, McNemar, Sign, Wilcoxon, Walsh, Randomisation (2), Fisher, Median (+extension), Mann-Whitney, Wald-Wolfowitz, Moses, Cochran, Friedman, Kruskal-Wallis, Contingency, Spearman, Kendall, Kendall partial, Concordance.

"tremendous value" - Tony Kendle, Popular Computing Weekly, 8-14th May 1986.

"I now give it an unreserved recommendation..." - Jo Stork, Business Computing with the Amstrad, July 1986.

AMSTAT 3: FORECASTING

An array of business oriented mathematical and statistical software: Linear and Polynomial regression, Trend and Seasonal Variation, Multiple Regression Analysis, Transformations, Exponential Smoothing, Adaptive Filtering, Graphic display, full print-out, manual suited to immediate use and for teaching.

AMSTAT 4: RESOURCE MANAGEMENT - LINEAR PROGRAMMING MODULE

General Purpose Linear programming + Specialised Transportation and Assignment variants. Capable of analysing and solving problems of sequencing, scheduling, blending, and allocation of scarce resources. 40 page manual, 18 worked examples.

AMSTAT 6: SFANOVA - Up to 8-way analysis of variance for equal cell sizes. Unequal cell sizes on 1-way AOV. Maximum of 2,000 data points (300 on unexpanded CP/M 2.2). Input for ASCII files. Output to screen or text file with full AOV table + main and interaction means and Newman-Keuls on main effects. Manual (disc only).

AMSTAT 7: RESOURCE MANAGEMENT II - STOCK AND PRODUCTION ANALYSIS Calculation of optimum re-order levels for both single and multiple items. Dynamic programming to calculate optimum production schedules for single items and consolidation of several results into a multiple schedule. Also Pareto and Lorenz analysis. Output to screen or printer. Includes operational manual with worked examples.

The programs have applications in research of all kinds, education, sales, production planning, work and method study, financial planning, personnel, social work etc.

Programmers

68000, 6502 Z80 programmers urgently required to work on a subcontract basis on arcade game projects, for publication by the largest European software house.

We have work waiting for all types of programmers, games designers and artists.

Help available for equipment acquisition. Excellent contract fees payable. Stage payments available.

Please write immediately with samples of work if possible!

**Mike Woodroffe, PO Box 786
Sutton Coldfield
West Midlands B76 7RZ**

All letters will be answered immediately and will be treated in strictest confidence.

All work is carried out exclusively for US Gold

If you are a Z80 Programmer living in West Midlands and you want to earn between 18-24 thousands! per annum in sub contract fees, then contact me!

MIKE WOODROFFE

NOW!

Experience of Spectrum and/or Amstrad and/or MSX would be an advantage but not essential.

Don't delay, call today for that positive career move.

SOFTWARE

LOOK! NEED HELP? . . . well, read on

If you are an owner of Amstrad CPC or PCW, and don't ever get a chance to help other users, write reviews or air your opinions — NOW YOU CAN.

Amstrad CPC Newsletters and PCW File provide these opportunities and include hints and tips to keep you going!

But the best part is, it's *NON-PROFIT MAKING* CPC Newsletters are £5 for 6 and PCW files are £7 for 6 *FANTASTIC* issues. And, of course, you get access to the Public Domain Library *ABSOLUTELY FREE* when you subscribe to all issues.

What more could you ask for? Give it a go and you'll be back for more and more. Send for a sample, just enclose a SAE — you'll be very surprised.

60p for CPC Newsletter. PCW File £1.25

Atari 800 XL / 130 XE Essential Utilities

Transdisk Version 3.0

The most powerful tape to disc system for the Atari now made even better. Transfers commercial, machine code, "boot" cassette games or any other software to disc. Single, multi-tape and now even non-standard format tapes present no problem to Transdisk. Plus, enjoy the convenience of loading and running your newly transferred software from an autorun disc menu. No other tape to disc utility for the Atari is as powerful or successful as this! £19.95 inc. Supplied on disc with instructions.

The Freezer!

An amazing new utility for the Atari! "Freezer!" programs while they are RUNNING on your computer. The Freezer then takes over control and allows you to make a back-up copy of the frozen program. The back-up copy will load, and restart from the frozen point, on ANY Atari XL/XE computer, independent of The Freezer! Freezes disc OR tape programs even those that are heavily protected! Easy to use - hit one key to freeze the program in memory then insert a blank disc and hit another key to save it - that's it! £19.95 inc.

Send an S.A.E. or phone for more details of these utilities.

Special offer order both programmes for £35.00

Make Cheque or P.O. payable to DIGICOMM and send your order to:

MONEY FROM YOUR AMSTRAD PCW

Got a PCW? Or just thinking of buying one? Either way you can't go wrong, the PCW is the perfect small business computer. Did you realise, though, just how many ways there are of making money with one? I don't mean running your own business, but carrying out simple tasks for other people. Tasks which are very well paid.

Experienced user or beginner, we can show you how to make real money, full or part time, providing straightforward computer services. No programming, no hard selling, no hassling, and you operate at home. Companies spend more every year on computer services. Don't miss your opportunity in this exciting and growing field!

Write or phone for free details of this complete business plan specifically for the Amstrad PCW owner.

Program *Alternate Reality - The Dungeon* **Type** Role-playing game **Price** £19.99 **Supplier** US Gold, Units 2/3, Holford Way, Holford, Birmingham B6 7AX.

Sequel to the original *Alternate Reality*, this one lets you take your Dungeons and Dragons type character into a subterranean dungeon filled with all sorts of monsters and treasures. One of the better computerised RPGs.

Atari ST

Program *Deathstrike* **Type** Arcade **Price** £14.95 **Supplier** Talent Computer Systems, Curran Building, 101 St James Road, Glasgow G4 0NS.

continued on page 43 ►

Athena is the latest coin-op conversion from Imagine and features the exploits of the mythological heroine as she attempts to seek out and overcome the three-headed bad guy (or bad-horse in this case) who lies in wait in the game's final screens.

The game loads in several parts, each part representing a different level or world - forest, sea, sky, ice, fire, and hell. The cassette inlay tells you that Athena was the goddess of wisdom, and, faced with an unending stream of monsters as she fights her way through each world, Athena does what any wise person would do. She pounds them all into the ground.

You are unarmed at the start of the game, but as you move on you will come across a number of brick structures and smashing your way through these will reveal additional weapons as well as clearing your path. You'll also be able to find extra armour (which you will definitely need), and the occasional pair of wings to boost your manoeuvrability.

The graphics tend to look a little bit squashed at times, but it's not clear what some of the 'monsters' are supposed to be. The instructions mention witches and minotaurs, and these are clear enough but there's no mention of the little things that look like demented potatoes or the flying apples (fireballs?).

Control of Athena is the usual left/right, jump/duck and fire, which is simple enough, though Athena isn't as quick a mover as she could be. The various monsters come at you at such a rate that you need to be able to change direction and fire more quickly than the game allows.

It gets a bit frustrating at times when you're pumping away at the fire button and still facing the wrong direction. And at times the sheer number of monsters on the screen mean that you don't really stand a chance no matter how fast your reflexes are.

Still, there are some well thought-out details in the game; progress through each world isn't strictly linear, which means that you don't get bored going through the same fixed sequence all the time.

There are two possible exits from each world, one harder than the other, and (a hugely sensible idea) at the end of each game you get the option of continuing from where you left off.

This eliminates the boredom of going over the early parts of the game over and over, though you're only allowed to do this three times.

All in all, *Athena* is a competent enough game though it isn't really action packed enough to be one of Imagine's best arcade conversions.

Cliff Joseph

Program *Athena* **Type** Arcade **Micro** Spectrum **Price** £7.95 **Supplier** Imagine Software, 6 Central Street, Manchester.

Life on the Eastern wave

Trading has been the staple diet of computer strategy games since the days of the ZX81, so yet another such game is breaking no new ground. But wait, this is Ocean's *Tai-Pan*, a game launched somewhat prematurely in May, and only now becoming available, on the ST

speed things along. The idea is to make your fortune and raise yourself to the status of Tai-Pan (supreme leader). If that sounds like a watery *Elite* then, you're right, it is.

The first task to be done is to find the restaurant in Canton wherein, you'll be offered a meal. Refuse the meal; after all,

evident. The streets are laid out so that you move left to right, and when you want to move to another street you must find one of the interconnecting screens, and then push the joystick or mouse forwards.

Unfortunately some of the time there is no indication that you have actually gone anywhere if the next street has an interconnecting screen in the same place.

What is more confusing is when you leave one end of a street and it throws you straight into the interconnecting screen on the previous level, ie, you did not move back a level deliberately.

Compressed

All this is, in some ways due to the fact that the program was written in full before being compressed, a task which obviously proved difficult for the programmers. Another victim is the interiors of the buildings. There aren't any. All you get is a pattern representing that establishment.

However, once you've sorted your land-based duties out you can set off to make your fortune. Once at sea you must remember to feed your lads, otherwise discontent will be rife and not only won't they fight very well if attacked, they may even mutiny.

Essential items for sailing are the sextant, map, compass, telescope and weapons/cannon shot for when you are attacked. Sticking to the trade routes is safer but takes longer to complete journeys, so you

may wish to chance your arm by crossing the seas. If you are committed to a life of piracy then the shipping lanes are the places to be.

One of the benefits of leading a life of crime is that if you manage to board and then overcome the crew of a ship you take control of the vessel and can then direct its actions. If you have enough crewmen left over from the battle, that is.

Primary victim

The primary victim on the memory saving altar appears to have been the sound effects, which are very ordinary. The standard of Pete Lyons graphics is somewhat uneven to boot. Some are quite average while other scenes are very nicely done indeed.

Tai-pan is evidently huge, and looking at some of the unwieldy elements in it, I wonder how the highly compressed Spectrum 128 version will play.

Despite the faults, which I feel could have been rectified if the game had been supplied on two discs, *Tai-Pan* on the ST is a well above average trading game which will interest all strategy fans.

Duncan Evans

'Real Soon' and on the Spectrum, which is supposed to be imminent.

The object in *Tai-Pan*, which is based on James Clavell's book of the same name, and set in China in the 1840's is of course, to get rich. But there's more to it than that. For one thing you must raise the finance for a ship and then pay it back within six months or risk losing your head.

That accomplished you must roam the seas, sticking to the trade routes, if you're of a cowardly nature, trading enough goods, and indulging in a spot of smuggling and piracy to

you don't have any money to start with, and you are taken to a back room where you are given a loan of \$300,000.

From there you can nip down to the bank to buy a ship, although you can only afford the cheapest two at the moment. Wander round to an inn to recruit people, or try press ganging them, then down to the warehouse for equipment and supplies.

Around the towns are other intriguing places like smugglers' conventions and gambling dens, even munitions factories.

When you're in a town, one of the faults in *Tai-Pan* becomes

WHO'S BEHIND THE MASK?

NEW RELEASES

A great many of this summer's more interesting releases have been compilations, as the software companies keep their respective 'great game concepts' under wraps until the autumn; it's the post - *Exploding Fist* theory of the Summer Hit.

This particular example is *The Edge's* - a compilation for Spectrum, Commodore 64 and Amstrad with a different selection on each.

All versions of the collection include *Bobby Bearing* and *Brian Bloodaxe*. *Bobby* is perhaps the best of the various *Marble Madness* clones that have been going around (and the Spectrum version is particularly impressive), in which Bobby the bearing goes rolling around a complex 3D landscape in search of his kidnapped brother bearings.

Brian Bloodaxe is a sort of deranged platform game in which you play a viking out to conquer Britain. The different screens represent areas of Britain, and there's an element of object manipulation just to spice things up a little.

After these two games the Amstrad version has only one more title - *Palitron*, a nifty futuristic arcade adventure. Though there are demo versions of two other games included, there are only three full games on this version, but it is £2 cheaper than either the Spectrum or C64 versions.

The C64 collection also includes *Quo Vadis*, *Wizardry*, and *Firequest*. *Quo Vadis* is probably the least appealing of these, having 1000 screens but not much else. *Firequest* is OK, and *Wizardry* is very good indeed.

The Spectrum version is completed by *Starbike* (a souped-up version of *Lunar Jetman*, but one which looks a little dated), *Psytrax*, another 1000 screen game which gives so much memory space to cramming all the screens in that there's not much room left for gameplay; and finally *That's The Spirit*. This is something of a novelty, it's an animated adventure in which you enter using single key commands. The purpose of the game is to rid New York of evil spirits.

It's an odd little game, but I remember enjoying it when it first came out, and it hasn't dated as much as some of the pure arcade games.

All versions of the collection are worth buying; the Amstrad has only three games but they are all high quality. The Spectrum and C64 versions are a little less consistent (with the C64 perhaps having the pick of the bunch), but the extra two games make up for the price increase.

Program *Classix 1* **Type** Compilation **Micro** Spectrum, Amstrad CPCs, C64 **Price** £8.99 Spectrum, £8.99 C64 tape (£12.99 disc), £8.99 Amstrad tape (£14.99 disc) **Supplier** The Edge, 35-37 Southampton Street, London WC2.

◀ continued from page 43

ware, PO Box 88, Reading, Berkshire RG7 4AA.

A seven game compilation tape featuring an assortment of shoot 'em ups, arcade adventures, and even a fruit machine simulation.

None of the games are all that incredible, but there's enough of them on the tape to make it reasonable value.

a bit in comparison with the original, but the game itself is still enjoyable. You control the movements of a bouncing creature across an alien landscape, shooting the aliens and avoiding their traps as you head for a showdown with the evil Zark.

Program *Athena* **Type** Arcade **Price** £7.95 **Supplier** Imagine, 6 Central Street, Manchester M2 5NS.

See panel for comment.

Spectrum

Program *Classix 1* **Type** Compilation **Price** £8.99 **Supplier** The Edge, 35-37 Southampton Street, London WC2.

See panel for comment.

Program *Wizball* **Type** Arcade **Price** £7.95 **Supplier** Ocean, 6 Central Street, Manchester M2 5NS.

Spectrum version of a recent C64 game. The graphics do suffer quite

Program *Joe Blade* **Type** Arcade **Price** £1.99 **Supplier** Players, Mercury House, Calleva Park, Aldermaston, Berks RG7 4QW.

A modest little shoot 'em up game, but one with a nice feel to it. The graphics are a bit better than in the average budget game, in a cute, cartoony style, and there's an additional soundtrack for owners of 128 machines.

FREE SOFTWARE WITH ALL REPAIRS

As illustrated value £9.99 (or similar subject to availability) will be sent with all completed repairs during September. Maximum repair prices:

Commodore 64	Amstrad 464
£35	£38
BBC 'B'	Spectrum
£38	£18

MICRO CLINIC

For a Professional and Efficient Repair Service

WHY ARE WE DIFFERENT TO MOST OF OUR COMPETITORS?

- ☐ The whole computer is guaranteed for 4 months!
- ☐ Every computer is fully soak tested before return!
- ☐ All leading makes of computer repaired.
- ☐ We don't say 24 hour service and then take 3-4 weeks!

Just pack your computer carefully, if in doubt include power supply.

- (ii) Include cheque/postal order to MICROSNIPS Ltd.
- (ii) Or pay by ACCESS/VISA/SPECTRUM Charge Card/Lombard Tricity Card giving Card No. and Expiry Date

Prices shown are guaranteed maximums - subject to no tampering! And include return postage (for Group 4 Courier - Add £8)

Writers' block

In the past few months, home computer software companies have started advertising for programmers and games designers on an unprecedented level. Just glancing through a number of recent publications reveals offers from Ocean, US Gold, Domark and Palace, to name but a few. The very fact that the adverts are there, surely gives a clear indication of the shortage of high quality programmers and graphic designers in the software industry.

The reasons for this shortage, which at first appears strange, considering that Britain is supposed to be highly 'computer literate' are, in fact, directly linked with the changes in the industry in recent years. The first major reason is that the industry has been shrinking. At the height of the computer boom a couple of years ago, games software was bought regularly and in large quantities by people seeking something to do on their machines.

As the boom receded, the sales of computers declined, and thus so too did the sales of games, as those people who only bought computers to be 'up' with the latest fad tucked their machines under the stairs to gather dust. This left only the 'hardcore' of computer users, many of whom used their machines more for 'serious' use than for playing games.

With fewer games being bought, further factors came into play. Firstly, competition between suppliers increased. In the early days, software was programmed by individuals who did everything themselves in their spare time, and then put a small black and white advert in a magazine to advertise their products, which were available only by mail order. Since computer owners had no other source of software, they had no choice but to buy such products, which were often awful.

Eventually the market grew to a level where businessmen rather than programmers became interested, and the larger software companies were formed.

With more professional organisation, and more money, behind them, they launched new products into the high street shops with increasingly large numbers of expensive, full colour advertisements. There was little room for the small programmer.

The other reason was the higher quality of the programs. Spurred on by the need to produce more sophisticated programs to catch the purchasers' money, the quality of software increased in vast leaps as programmers teamed up with graphic and game designers. The small programmers, working in their spare time and on their own, could not hope to match these programs. Again, they were forced out.

At the same time, many people who did program full-time found that the rewards were not all that they had promised to be. The Porsches and £35,000 a year earnings often did not materialise even if their games were hits (and most were not). Eventually these people gave up, and went to get jobs elsewhere.

And thus today, there are not enough good programmers or designers to go around, especially programmers with the necessary skills for the new 32-bit machines. Even many of the early 'hackers' are no longer interested in computers, and the teen age 'whizz kids' have abandoned their machines to concentrate on exams and employment.

The users of the main 'boom' of 1983/84 often cannot program, their interest in computers never having gone beyond playing games. The adverts for programmers still mention money to be made ("How rich do you want to be?" runs the Ocean ad), but the gloss has worn off and much of the talent has departed, leaving the generally stagnated computer games industry that we all know today. Many of the people who provided originality and skill find that it's simply no longer worth it.

Robert Halliday

Puzzle No 272

Can you work out the following multiplication?

abc * bca * cab = 186599374

As can be seen, each of the three-digit numbers to be multiplied consists of the same three digits, though differently arranged. The final product is a nine-digit number, but unfortunately it is *not* the one given above!

In fact, the value shown could not be more wrong as every digit in the correct answer is *not* the digit shown in the corresponding position here. For example, the first digit of the answer is not a one, the second digit is not an eight, and so on.

All we need to know is the correct nine-digit product. Can you find it?

Solution to Puzzle No 267

Jamie's only chance of winning is if he scores two threes, two 12's, a seven, and a 28. Together with the 35 that he has already scored, this would bring his total up to 100.

The program assesses the scores obtainable for all combinations of rolls of the remaining six balls. These are defined by the six loops A to F at lines 40 to 90. The array S() is loaded with the eight possible scores, and this is used to assess each total in turn. Those which sum to 65 (100 less the 35 already scored) are printed out.

```

10 DIM S(8)
20 RESTORE
30 FOR Z=1 TO 8:READ S(Z):NEXT
40 FOR A=1 TO 8
50 FOR B=A TO 8
60 FOR C=B TO 8
70 FOR D=C TO 8
80 FOR E=D TO 8
90 FOR F=E TO 8
100 T=S(A)+S(B)+S(C)+S(D)+S(E)+S(F)
110 IF T=65 THEN PRINT S(A),S(B),S(C),S(D),S(E),S(F)
120 NEXT F:NEXT E:NEXT D:NEXT C:NEXT B:NEXT A
1000 DATA 3,7,12,26,28,35,45,51
  
```

Winner of Puzzle No 267

This week's winner is Robert Doughty, of Stowmarket, Suffolk, who will receive £10.

Rules

The closing date for Puzzle 272 is September 16.

THE REVIEWERS ARE RAVING... "WIZBALL IS THE FINEST RELEASE THIS YEAR"

"At last, something to enthuse about!... A breath of fresh air... A very individual concept... loads of neat touches... gorgeous animation... I could go on and on... the music and sound effects are great... It's a distinctly professional production, its style and content placing it head and shoulders above existing software... **Wizball is simply brilliant** - one of the best-presented, most graphically and aurally attractive and addictive pieces of software available. **Wizball is the finest release this year.** The scenario and game design are so original... Playing is a joy... The graphics, sound and general

presentation are second to none, and combined with the thoughtful attention to detail and the comprehensive series of game variations, you end up with something rather special. Don't delay, go to your software shop and say 'Mr. Retailer, swiftly hand me a copy of Wizball so that I can go home and play it forthwith'. **An essential purchase!** 'A superlative piece of software. Slick in virtually every aspect, wholly original and immensely playable.' ZZAP! 64

**Screen
Star**

"The sound throughout is great. This is definitely one groovy game... Enough imagination has gone into it to make it different and still keep it immensely playable. Graphics are fab!" **COMMODORE USER**
